Surface made from stainless steel

// *Stainless steel*

The bright-rolled stainless steel is smooth and has not been ground, and so nothing can remain attached to or penetrate the surface. The stainless steel surface thus fulfils the demanding hygiene requirements for internal

use in foodstuff processing operations. The surface is a winner because of its remarkable properties, which are above all characterised by high corrosion resistance and a long working life.

// *Product features*

- provides a particularly advantageous combination of workability, mechanical properties, and high corrosion resistance
- is simple to clean (it is extremely difficult for dirt, bacteria, and corrosive substances to adhere)
- has very good resistance to mechanical damage to the surface, which is extremely abrasion-resistant.
- suitable for interior applications
- temperature-resistant

// *Specific areas of application:*

- Food industry (fish and meat processing, dairies, cheese factories, baking lines, etc.)
- Machine engineering
- Pharmaceutical industries
- Medical engineering
- Beverage production
